

8. (currently amended) Apparatus for scanning an image and printing copies of the image on a sheet, the apparatus comprising:

 a scan module;

 a print module;

 an input device for allowing at least a first photo size, a second photo size, and a Photo Package entry a standard photo size to be selected; and

 a controller for causing the scan module to scan the image, the controller automatically determining actual size of the scanned image, generating first scanned image copies that are scaled to the first selected photo size and that are positioned to utilize maximum printable area on the sheet, and causing the print module to print the first copies on the sheet, ~~wherein the input device also allows a Photo Package entry to be-selected, and~~

wherein the controller is configured to, when the Photo Package entry is selected, generate second scanned image copies that are scaled to the second photo size and causes the scan-module print module to print the second copies of a different photo size on an additional sheet when the Photo Package entry is selected.

9. (previously presented) The apparatus of claim 8, wherein the input device prompts for additional standard sizes.

10. (cancelled).

11. (currently amended) An article of manufacture for an apparatus including a scan module, a print module, an input device, a display device, and a processor, the article comprising:

 computer memory; and

 a program stored in the computer memory, the program, when executed, commanding the processor to display a Photo Features entry on the display device; the program commanding the processor to command the scan module to perform a pre-

scan when the Photo Features entry is selected via the input device;

the program further commanding the processor to automatically determine actual size of an output of the scan module after the pre-scan is performed; command the scan module to perform a full scan; generate first scaled copies of an output of the scan module after the full scan is performed, the first copies being scaled to a first size indicated by the selected entry;

the program further commanding the processor to rotate the copies if necessary to utilize maximum printable area on the sheet; and cause the print module to print the first copies on the sheet,

wherein the program commands the processor to display a Photo Package entry on the display device, and wherein the controller generates second scaled copies of the output of the scan module, the second copies being scaled to a second size indicated by the selected entry and the controller causes the scan print module to print the second copies of a different size on an additional sheet when the Photo Package entry is selected via the input device.

12. (new) Apparatus for scanning and printing copies of an original image, comprising:

a scan module operable to scan the original image;
a print module operable to print copies of the original image;
an input device operable to allow one or more photo sizes to be selected; and
means for causing the scan module to scan the original image, the means automatically determining an actual size of the scanned image and scaling copies of the scanned image to a photo size selected via the input device, the means also causing the print module to print the copies on a sheet.

13. (new) The apparatus of claim 12, wherein the input device also allows a Photo Package entry to be selected, and wherein the means scales additional copies of the scanned image to an additional photo size selected via the input device and causes the additional copies to be printed on an additional sheet when the Photo Package entry

entry is selected.

14. (new) The apparatus of claim 12, wherein the means also rotates at least one copy to utilize maximum printable area on the sheet.
